

Remote Sensing Models for Whitebark and Limber Pine Mapping

Andrew Befus
University of Calgary

Introduction: Raison d'être

1. Build a model

- Ideally, a model would compliment known controls on whitebark and limber pine distribution

2. Convert the model into a map

Introduction: 2 Main Things

1. Model → Map software

2. Equipment & methods for alpine vegetation surveys using UAV

Introduction: Study Area

Model Building: Ground Truth

1. ACIMS Archive

2. Field Campaigns

3. Aerial Photo Interpretation

Ground Truth: ACIMS Archive

Element Occurrence Record

2010-05-06

Page #: 78

Pinus albicaulis

SRank: S2

Are Occurrences Tracked?: Y

Global Rank: G4

Alberta Wildlife Act Designation:

Alberta General Status: May Be At Risk

whitebark pine

Element Code: PGPIN04010

Occurrence Code #: 022

Eo_id: 18020

Type: Sub

Data Entry Quality Checked?: N

Identification OK?:

Actual Mapping Precision (m): 15

Precision Code: S

Data Sensitive?: N

Survey Date: 2003-07-15

Last Observed: 2003-07-15

First Observed: 2003-07-15

Occurrence Type:

Related Occurrence (EO)	Master (M) or Sub (S)
251	M

Note:

A Sub EO will show only the related Master EO in this list.

A Master EO will list all Sub EOs related to it.

A Master EO is always related to itself.

Location (Coordinates shown are "centroid" of occurrence polygon(s))

UTM Grid Zone: 11

UTM Easting NAD83 (m): 494315

UTM Northing NAD83 (m): 5780683

10TM Easting NAD83 (m): 357619

10TM Northing NAD83 (m): 5780411

Latitude: 52°10'35.74"

Longitude: -117°4'59.31"

Directions: Banff National Park; Backside of Parker Ridge

General Description: Open Pinu alb and closed Pinu alb - Abie las

Minimum Elevation: 2153 m

Slope: 50.00

Size of Occurrence: 0.00

Maximum Elevation: 2164 m

Aspect:

Occurrence Data

Ground Truth : ACIMS Archive

Single Point or Area Plot assumed to be in center of stand
Point is at location of a tree (within 15m)
Point has been verified (or moved) to lie within a homogeneous stand between two or more verified points
Point is halfway between two close proximity points on a two-point transect
Point is halfway between two close proximity points on a multiple-point transect
Point is average of a cluster of points on a multiple-point plot
Point placed on a transect between 30-100m from endpoint - based on RGB imagery
May need work: Point is halfway between two distant proximity points on a two-point transect
Point may not represent a stand - only one or two trees spotted or not representative
Bad point - reasoning specified in plot notes

Table 1. Criteria for determining presence or absence score (SCORE)

Score	Trees Distinguished within Kernel	Trees Distinguished within Plot	Result	Classification
0	Yes	Yes	No WBP in entire kernel	Absence
1	No	Yes	Unlikely to be WBP in kernel	Absence
2	Yes	No	If there are WBP in kernel, they're too small or their crowns are indistinguishable	Absence
3	Yes	No	Habitat in representative kernel is different from regions of confirmed absence and may contain WBP	Unconfirmed
4	No	No	The plot is likely absence, but not confirmed in surrounding kernel	Unconfirmed
5	No	No	Equal likelihood of presence or absence	Unconfirmed
6	No	No	The habitat observed indicates likely presence, but not confirmed	Unconfirmed
7	No	No	Habitat in kernel is similar to regions of confirmed presence but may not contain any WBP	Unconfirmed
8	Yes	Sort of	Confirmed WBP in plot but rare in kernel	Presence
9	No	Yes	Confirmed WBP in plot and most of kernel	Presence
10	Yes	Yes	WBP in entire kernel	Presence

Ground Truth: Aerial Photos

Table 2. Criteria for determining representative score (REP SCORE)

Score	Certainty
0	Unusable Plot
1	Absence is obvious
2	Plot contains less than 25% homogeneity
3	Plot contains less than 50% homogeneity
4	Plot contains less than 75% homogeneity
5	Representative in plot, kernel contains less than 25% representative
6	Representative in plot, kernel contains around 50% representative
7	Representative in plot, kernel contains more than 75% representative
8	Representative for 100m
9	Representative for 300m
10	Representative for 500m

Developing the Model

1. Explanatory Variables

2. Choosing Model Type

3. Converting the Model to a Map

Model: Explanatory Variables

1. Spectral variables

- Calculated from Landsat ETM

2. Topographic variables

- Calculated from digital elevation

Model: Explanatory Variables

Landsat BAND	Wavelength	Use
BAND 1	Blue	Differentiates soil and rock from vegetation
BAND 2	Green	Covers green reflectance peak from leaves
BAND 3	Red	Senses chlorophyll absorption region
BAND 4	Near Infrared	Vegetation biomass and vigor; soil moisture
BAND 5	Mid Infrared	Vegetation moisture and soil moisture
BAND 6	Thermal	Vegetation stress
BAND 7	Mid Infrared	Vegetation moisture and rock type

Lillesand, Kiefer, and Chipman, 2004

Model: Explanatory Variables

1. Spectral variables

- Calculated from Landsat ETM

2. Topographic variables

- Calculated from digital elevation

Model: Explanatory Variables

1. Spectral variables

- Calculated from Landsat ETM
- Tasseled Cap

2. Topographic variables

- Calculated from digital elevation

-> class Presence [0.895]

Default class: Absence

Model: Converting Model To Map

Whitebark Presence

Improving The Model

1. More/different explanatory variables

- Topographic roughness, disturbance index

2. Modelling tactics

- Reduce variation – stratify sample
- Utilize error values
- Group stands into objects

3. More data

4. Better data

Better Data

- **Location, location, location**
 - **Especially with distance surveys!**
- **Consistency**
- **Need to save money, but clustered sampling is really bad for modelling**
- **Fixed wing surveys seem like cheap alternative, but can be problematic**
- **Helicopter surveys notoriously expensive, often yield poor results**
